## Container Watering Made Simple.

Connecting to an existing underground sprinkler system.

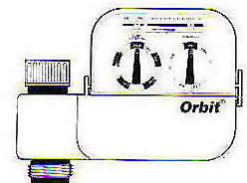

1. Remove the sprinkler head from a 1/2" riser.
2. Attach your micro-irrigation head to the riser. Re attach sprinkler head if you selected a pass through manifold.
3. Attach 1/4" micro tubing to the manifold and to micro-irrigation heads for each container or basket.
4. With the water on adjust the flow control and the height of the micro-sprinkler to keep the water in your container.
5. After you have adjusted your water flow, it is a good idea to place the micro-sprinkler in a bucket and run it through a cycle so that you know how much water you are applying. It may be necessary to put more than one micro-sprinkler in container to get enough water.

An alternate would be to attach a micro-tube to a faucet. Use a pressure regulator and back flow preventor. You can also add a countdown timer if you have a problem remembering to shut the water off.

Another available option for a faucet based system is a automatic on/off timer. It can be programmed to water as often and as long as desired. A great idea for a worry free vacation.
